

Slide 1

RedOx Chemistry

OK, I balanced the frigging equation, so what?

Slide 2

An example of an Electrochemical Reaction

Oxidation half-reaction: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$

Reduction half-reaction: $\text{Sn}^{4+} + 2 \text{e}^- \rightarrow \text{Sn}^{2+}$

Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

So frigging what?

Well a couple things:

Slide 3

Looking back at our first example..

$2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

A couple frigging things:

- 1) It is a different set of compounds. If I mix Fe^{2+} and Mn^{5+} and IF the reaction above happens, the stuff in my beaker is different.
- 2) Electrons move...think lightning and kites.

Slide 4

WTFDYMBI?

What do you mean by "IF"?

$$2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$$
$$2 \text{Fe}^{3+} + \text{Sn}^{2+} \rightarrow 2 \text{Fe}^{2+} + \text{Sn}^{4+}$$
$$2 \text{Fe}^{2+} + \text{Sn}^{4+} \leftrightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$$

Is this just another case of equilibrium...?

Slide 5

Not Usually

Only one of the reactions will happen.
That's why your rusty car never de-rusts!

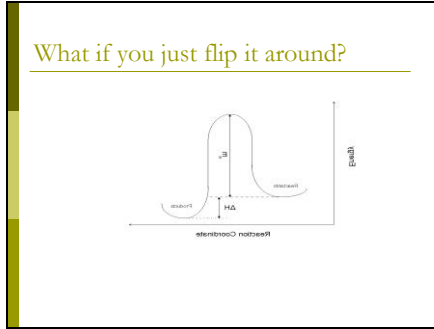

Why is that? Well, I thought you'd never ask?

Slide 6

Typical Reaction Energy Diagram

The diagram shows a potential energy curve. The vertical axis is labeled 'Energy' and the horizontal axis is labeled 'Reaction Coordinate'. The curve starts at a local minimum labeled 'Reactants', rises to a peak labeled 'E_a', and then falls to a lower minimum labeled 'Products'. A vertical double-headed arrow between the reactant and product levels is labeled 'ΔH'. A vertical arrow pointing from the reactant level up to the peak is labeled 'E_a'.

Slide 7

Slide 8

So what?

We've seen the reaction diagrams before, what does it mean?

Reactions can only do 4 things:

- 1) Not happen at all – boring!
- 2) Proceed as written
- 3) Proceed in reverse
- 4) Sit at equilibrium

How do you decide what they do?
Yes, that's right, ΔG !

Slide 9

WTFIDG?

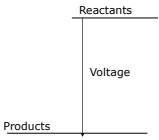

Well, we don't know what ΔG is yet, but I'll tell you this: it is related to the second frigging thing – electrons are moving around.

Slide 10

If electrons are going to move...
...somebody needs to give them a push!
Once they've been pushed, they just fall down the hill!
ElectroMotiveForce (emf) is the push.
You know it more by the name of its unit: volts!

Slide 11

EMF is really the push behind the electrons. The voltage is the potential difference between reactants and products (like altitude).
You can't fall uphill!

Slide 12

The Cell Potential
The voltage difference is called the "cell potential" and it depends on a number of factors (the usual suspects: temperature, concentration, pressure etc.).
The starting point is STANDARD cell potentials (E^0) - which can be found in the Table in Appendix II

Slide 13

Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$ $E^0_{\text{red}} = 0.77 \text{ V}$
Red : $\text{Sn}^{4+} + 2 \text{e}^- \rightarrow \text{Sn}^{2+}$ $E^0_{\text{red}} = 0.15 \text{ V}$
Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$
So, I got the number from the table, what do I do with them?

Slide 14

They aren't all red!
Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$ $E^0_{\text{red}} = 0.77 \text{ V}$
Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$ $E^0_{\text{ox}} = -0.77 \text{ V}$
Red : $\text{Sn}^{4+} + 2 \text{e}^- \rightarrow \text{Sn}^{2+}$ $E^0_{\text{red}} = 0.15 \text{ V}$
Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

Slide 15

What about the Stoichiometry?
Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$ $E^0_{\text{red}} = 0.77 \text{ V}$
Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-$ $E^0_{\text{ox}} = -0.77 \text{ V}$
Ox: $2(\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 \text{e}^-)$ $E^0_{\text{ox}} = 2(-0.77 \text{ V})?$
Red : $\text{Sn}^{4+} + 2 \text{e}^- \rightarrow \text{Sn}^{2+}$ $E^0_{\text{red}} = 0.15 \text{ V}$
Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

Slide 16

Ignore the Stoichiometry (clutch chest and fake heart attack)

Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 e^-$ $E^0_{\text{red}} = 0.77 \text{ V}$

Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 e^-$ $E^0_{\text{ox}} = -0.77 \text{ V}$

~~Ox: $2(\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 e^-)$ $E^0_{\text{ox}} = 2(-0.77 \text{ V})?$~~

Red: $\text{Sn}^{4+} + 2 e^- \rightarrow \text{Sn}^{2+}$ $E^0_{\text{red}} = 0.15 \text{ V}$

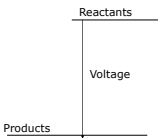

Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

Slide 17

Why no stoichiometry?

It's literally like an altitude. Two hills 100 foot tall aren't the same as 1 hill 200 feet tall.

You have more electrons falling down, but they all fall down the same distance.

Slide 18

So what does it all mean?

Ox: $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + 1 e^-$ $E^0_{\text{ox}} = -0.77 \text{ V}$

Red: $\text{Sn}^{4+} + 2 e^- \rightarrow \text{Sn}^{2+}$ $E^0_{\text{red}} = 0.15 \text{ V}$

Net: $2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$

$E^0_{\text{cell}} = E^0_{\text{red}} + E^0_{\text{ox}}$
 $E^0_{\text{cell}} = 0.15 \text{ V} + (-0.77 \text{ V}) = -0.62 \text{ V}$

The cell potential is negative - that means the reaction is NOT spontaneous.

Slide 19

Looking back at our first example..

$$2 \text{Fe}^{2+} + \text{Sn}^{4+} \rightarrow 2 \text{Fe}^{3+} + \text{Sn}^{2+}$$
$$E^{\circ}_{\text{cell}} = -0.62 \text{ V}$$
$$2 \text{Fe}^{3+} + \text{Sn}^{2+} \rightarrow 2 \text{Fe}^{2+} + \text{Sn}^{4+}$$
$$E^{\circ}_{\text{cell}} = +0.62 \text{ V}$$

Mixing Fe^{2+} and Sn^{4+} results in nothing happening.
Mixing Fe^{3+} and Sn^{2+} results in electrons moving.

Slide 20

Another example:

What is the cell potential of:

$$2\text{I}^{-}(\text{aq}) + \text{Br}_2(\text{aq}) \rightarrow \text{I}_2(\text{s}) + 2\text{Br}^{-}(\text{aq})$$

Slide 21

Split into $\frac{1}{2}$ reactions

$$2\text{I}^{-}(\text{aq}) \rightarrow \text{I}_2(\text{s}) + 2\text{e}^{-} \quad E^{\circ}_{\text{ox}} = -E^{\circ}_{\text{red}} = -0.54 \text{ V}$$
$$\text{Br}_2(\text{aq}) + 2\text{e}^{-} \rightarrow 2\text{Br}^{-}(\text{aq}) \quad E^{\circ}_{\text{red}} = 1.09$$
$$E^{\circ}_{\text{cell}} = 1.09 \text{ V} - 0.54 \text{ V} = +0.55 \text{ V}$$

So this reaction is spontaneous and there is an exchange of electrons that fall off a 0.55 V cliff.

Slide 22

What happens after electrons fall...

...they get married and raise quarks!

...nothing unless you catch them!

Think hydroelectric power or just an old mill wheel...if you catch the falling water, you can make it turn a wheel to do useful work.

Catch the falling electrons and use them to do useful work

Slide 23

Electrochemical cells

You know them as "batteries", although that is only one example.

Slide 24

To make a battery...

...I need to separate the half-cells!

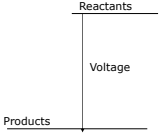

Why can't I mix them together?
They short-circuit!

If I put everything in a single beaker, they just react and I'm done. I need to separate the reactants from the products so I can "catch" the electrons!

Slide 25

Why no stoichiometry?

If I make the falling electrons pass through my electric device, I can use the energy they release as they fall to do something useful.

Slide 26

I need to be separate...

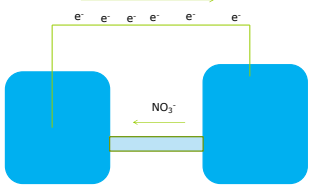

...but not too separate.

They need to be chemically isolated but electrically connected.

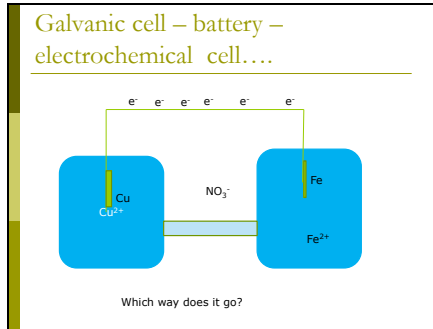

(see picture on white board! ©)

Slide 27

Galvanic cell – battery – electrochemical cell...

Slide 28

Slide 29

Whole bunch of possible reactions

$\text{Cu}^{2+} + 2 \text{e}^- = \text{Cu} \quad E_{\text{red}} = 0.34 \text{ V}$
 $\text{Fe}^{2+} + 2 \text{e}^- = \text{Fe} \quad E_{\text{red}} = -0.45 \text{ V}$

$\text{Fe}^{3+} + 1 \text{e}^- = \text{Fe}^{2+} \quad E_{\text{red}} = 0.77 \text{ V}$
 $\text{Cu}^{2+} + 1 \text{e}^- = \text{Cu}^+ \quad E_{\text{red}} = 0.16 \text{ V}$

Slide 30

Whole bunch of possible reactions

$\text{Cu}^{2+} + 2 \text{e}^- = \text{Cu} \quad E_{\text{red}} = 0.34 \text{ V}$ (could be either)
 $\text{Fe}^{2+} + 2 \text{e}^- = \text{Fe} \quad E_{\text{red}} = -0.45 \text{ V}$ (could be either)

$\text{Fe}^{3+} + 1 \text{e}^- = \text{Fe}^{2+} \quad E_{\text{red}} = 0.77 \text{ V}$ (could only do ox)
 $\text{Cu}^{2+} + 1 \text{e}^- = \text{Cu}^+ \quad E_{\text{red}} = 0.16 \text{ V}$ (could only do red)

Slide 31

E is like delta G is related to
"K"...biggest positive voltage wins

$\text{Cu}^{2+} + 2 \text{e}^- = \text{Cu} \quad E_{\text{red}} = 0.34 \text{ V}$ (could be either)
 $\text{Fe}^{2+} + 2 \text{e}^- = \text{Fe} \quad E_{\text{red}} = -0.45 \text{ V}$ (could be either)

$\text{Fe}^{2+} = 1 \text{e}^- + \text{Fe}^{2+} \quad E_{\text{ox}} = -0.77 \text{ V}$ (could only do ox)
 $\text{Cu}^{2+} + 1 \text{e}^- = \text{Cu}^+ \quad E_{\text{red}} = 0.16 \text{ V}$ (could only do red)

Slide 32

E is like delta G is related to
"K"...biggest positive voltage wins

$\text{Cu}^{2+} + 2 \text{e}^- = \text{Cu} \quad E_{\text{red}} = 0.34 \text{ V}$ (could be either)
 $\text{Fe}^{2+} + 2 \text{e}^- = \text{Fe} \quad E_{\text{red}} = -0.45 \text{ V}$ (could be either)

$\text{Cu}^{2+} + 1 \text{e}^- = \text{Cu}^+ \quad E_{\text{red}} = 0.16 \text{ V}$ (smaller than the Cu^{2+} to Cu reaction)

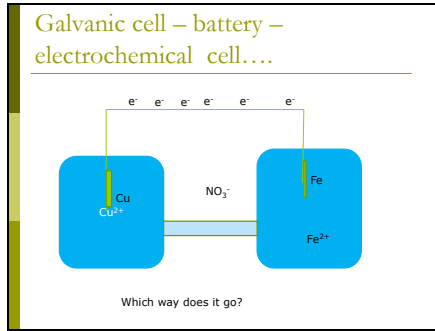

Slide 33

E is like delta G is related to
"K"...biggest positive voltage wins

$\text{Cu}^{2+} + 2 \text{e}^- = \text{Cu} \quad E_{\text{red}} = 0.34 \text{ V}$ (could be either)
 $\text{Fe}^{2+} + 2 \text{e}^- = \text{Fe} \quad E_{\text{red}} = -0.45 \text{ V}$ (could be either)

Iron must be oxidized or the E_{cell} would be negative and non-spontaneous.

Slide 34

Slide 35

Slide 36

Shorthand notation

$$2\text{I}^-_{(aq)} + \text{Br}_2_{(aq)} \rightarrow \text{I}_2_{(s)} + 2\text{Br}^-_{(aq)}$$

$$2\text{I}^-_{(aq)} \rightarrow \text{I}_2_{(s)} + 2\text{e}^- \quad E^\circ_{\text{ox}} = -E^\circ_{\text{red}} = -0.54\text{ V}$$

$$\text{Br}_2_{(aq)} + 2\text{e}^- \rightarrow 2\text{Br}^-_{(aq)} \quad E^\circ_{\text{red}} = 1.09$$

I could write it as a chemical reaction, but an electrochemical cell can also be written in shorthand as:

Ox reactant|ox product||red reactant|reduction product

$$\text{I}^- (1\text{ M}, \text{aq}) | \text{I}_2(\text{s}) || \text{Br}_2(1\text{ M}, \text{aq}) | \text{Br}^- (1\text{ M}, \text{aq})$$

Slide 37

Caveat

$I^-(1M, aq) | I_2(s) || Br_2(1M, aq) | Br^-(1M, aq)$

Of course the I^- and the Br^- might have a counterion present

$KI(1M, aq) | I_2(s) || Br_2(1M, aq) | KBr(1M, aq)$

Slide 38

Energy

We normally measure energy in "Joules".

Electron energy is sometimes measured in "electron volts" which kind of implies the connection between cell potentials and energy.

Cell potential is like a cliff. What has more energy, a 1 pound rock falling off a 50 foot cliff or a 10 pound rock?

Slide 39

Mass is to cliffs as _____ is to volts.

The 10 pound rock has more kinetic energy (mgh becomes $\frac{1}{2} mv^2$)

In an electron potential field, the equivalent concept to mass is the charge.

Charge is measured in "Coulomb"s ("C") and each electron has a charge of 1.602×10^{-19} C

Slide 40

A Joule is...

...a "Coulomb Volt".

Take the charge (# of electrons x each charge) and multiply it by the voltage.

Energy is, therefore, determined by the cell potential AND the number of electrons falling through it.
