Chemistry: A Molecular Approach, 1<sup>st</sup> Ed.  
Nivaldo Tro

**Chapter 19**  
**Radioactivity**  
**and Nuclear**  
**Chemistry**

Roy Kennedy  
Massachusetts Bay Community College  
Wellesley Hills, MA  
2008, Prentice Hall

---

---

---

---

---

---

---

---

Slide 2

**The Discovery of Radioactivity**

- Antoine-Henri Becquerel designed an experiment to determine if phosphorescent minerals also gave off X-rays

Tro, Chemistry: A Molecular Approach 2

---

---

---

---

---

---

---

---

Slide 3

**The Discovery of Radioactivity**

- Becquerel discovered that certain minerals were constantly producing penetrating energy rays he called **uranic rays**
  - ✓ like X-rays
  - ✓ but not related to fluorescence
- Becquerel determined that
  - ✓ all the minerals that produced these rays contained uranium
  - ✓ the rays were produced even though the mineral was not exposed to outside energy
- *Energy apparently being produced from nothing??*

Tro, Chemistry: A Molecular Approach 3

---

---

---

---

---

---

---

---

## Slide 4

### The Curies

- Marie Curie used electroscope to detect uranic rays in samples
- Discovered new elements by detecting their rays
  - ✓ **radium** named for its green phosphorescence
  - ✓ **polonium** named for her homeland
- Since these rays were no longer just a property of uranium, she renamed it **radioactivity**

Tro, Chemistry: A Molecular Approach 4

---

---

---

---

---

---

---

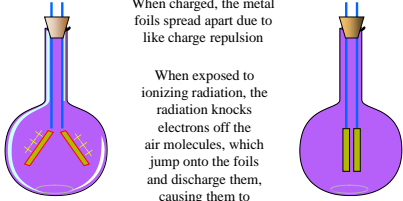

---

## Slide 5

### Electroscope

When charged, the metal foils spread apart due to like charge repulsion

When exposed to ionizing radiation, the radiation knocks electrons off the air molecules, which jump onto the foils and discharge them, causing them to drop down.

Tro, Chemistry: A Molecular Approach 5

---

---

---

---

---

---

---

---

## Slide 6

### Other Properties of Radioactivity

- radioactive rays can **ionize** matter
  - ✓ cause uncharged matter to become charged
  - ✓ basis of Geiger Counter and electroscope
- radioactive rays have **high energy**
- radioactive rays can penetrate matter
- radioactive rays cause phosphorescent chemicals to **glow**
  - ✓ basis of scintillation counter

Tro, Chemistry: A Molecular Approach 6

---

---

---

---

---

---

---

---

Slide 7

### Types of Radioactive Rays

- Rutherford discovered there were three types of radioactivity
- **alpha rays ( $\alpha$ )**
  - ✓ have a charge of +2 c.u. and a mass of 4 amu
  - ✓ what we now know to be helium nucleus
- **beta rays ( $\beta$ )**
  - ✓ have a charge of -1 c.u. and negligible mass
  - ✓ electron-like
- **gamma rays ( $\gamma$ )**
  - ✓ form of light energy (not particle like  $\alpha$  and  $\beta$ )

Tro, Chemistry: A Molecular Approach 7

---

---

---

---

---

---

---

---

Slide 8

### Rutherford's Experiment

Tro, Chemistry: A Molecular Approach 8

---

---

---

---

---

---

---

---

Slide 9

### Penetrating Ability of Radioactive Rays

Tro, Chemistry: A Molecular Approach 9

---

---

---

---

---

---

---

---

Slide 10

**Facts About the Nucleus**

- Every atom of an element has the same number of protons
  - ✓ **atomic number (Z)**
- Atoms of the same elements can have different numbers of neutrons
  - ✓ **isotopes**
  - ✓ different atomic masses
- Isotopes are identified by their **mass number (A)**
  - ✓ mass number = number of protons + neutrons

Tro, Chemistry: A Molecular Approach 10

---

---

---

---

---

---

---

---

Slide 11

**Facts About the Nucleus**

- The number of neutrons is calculated by subtracting the atomic number from the mass number
- The nucleus of an isotope is called a **nuclide**
  - ✓ less than 10% of the known nuclides are non-radioactive, most are **radionuclides**
- Each nuclide is identified by a symbol
  - ✓ Element -Mass Number = X-A

$$\begin{matrix} \text{mass number} \\ \text{atomic number} \end{matrix} \text{Element} = \begin{matrix} A \\ Z \end{matrix} X$$

Tro, Chemistry: A Molecular Approach 11

---

---

---

---

---

---

---

---

Slide 12

**Radioactivity**

- Radioactive nuclei spontaneously decompose into smaller nuclei
  - ✓ Radioactive decay
  - ✓ We say that radioactive nuclei are **unstable**
- The parent nuclide is the nucleus that is undergoing radioactive decay, the daughter nuclide is the new nucleus that is made
- Decomposing involves the nuclide emitting a particle and/or energy
- All nuclides with 84 or more protons are radioactive

Tro, Chemistry: A Molecular Approach 12

---

---

---

---

---

---

---

---

Slide 13

**Important Atomic Symbols**

Particle	Symbol	Nuclear Symbol
proton	p <sup>+</sup>	${}^1_1\text{H}$ ${}^1_1\text{p}$
neutron	n <sup>0</sup>	${}^1_0\text{n}$
electron	e <sup>-</sup>	${}^0_{-1}\text{e}$
alpha	α	${}^4_2\alpha$ ${}^4_2\text{He}$
beta	β, β <sup>-</sup>	${}^0_{-1}\beta$ ${}^0_{-1}\text{e}$
positron	β, β <sup>+</sup>	${}^0_{+1}\beta$ ${}^0_{+1}\text{e}$

13

---

---

---

---

---

---

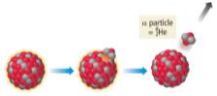

---

---

Slide 14

**Transmutation**

- Rutherford discovered that during the radioactive process, atoms of one element are changed into atoms of a different element - **transmutation**
  - ✓ Dalton's Atomic Theory statement 3 bites the dust
- in order for one element to change into another, the number of protons in the nucleus must change**

Tio, Chemistry: A Molecular Approach 14

---

---

---

---

---

---

---

---

Slide 15

**Nuclear Equations**

- we describe nuclear processes with **nuclear equations**
- use the symbol of the nuclide to represent the nucleus
- atomic numbers and mass numbers are conserved
  - ✓ use this fact to predict the daughter nuclide if you know parent and emitted particle

Parent nuclide → Daughter nuclides

$${}^{238}_{92}\text{U} \longrightarrow {}^{234}_{90}\text{Th} + {}^4_2\text{He}$$

Tio, Chemistry: A Molecular Approach 15

---

---

---

---

---

---

---

---

Slide 16

**Alpha Emission**

- an  $\alpha$  particle contains 2 protons and 2 neutrons
  - ✓helium nucleus
- most ionizing, but least penetrating
- loss of an alpha particle means
  - ✓atomic number decreases by 2
  - ✓mass number decreases by 4

${}^4_2\alpha$   ${}^4_2\text{He}$

$${}^{222}_{88}\text{Ra} \rightarrow {}^4_2\text{He} + {}^{218}_{86}\text{Rn}$$

Tro, Chemistry: A Molecular Approach 16

---

---

---

---

---

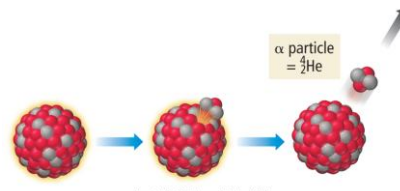

---

---

---

Slide 17

**Alpha Decay**

$\alpha$  particle =  ${}^4_2\text{He}$

Copyright © 2008 Pearson Prentice Hall, Inc.

Tro, Chemistry: A Molecular Approach 17

---

---

---

---

---

---

---

---

Slide 18

**Beta Emission**

- a  $\beta$  particle is like an electron
  - ✓moving much faster
  - ✓produced from the nucleus
- when an atom loses a  $\beta$  particle its
  - ✓atomic number increases by 1
  - ✓mass number remains the same
- in beta decay, a neutron changes into a proton

${}^0_{-1}\beta$   ${}^0_{-1}e$

$${}^{234}_{90}\text{Th} \rightarrow {}^0_{-1}e + {}^{234}_{91}\text{Pa}$$

Tro, Chemistry: A Molecular Approach 18

---

---

---

---

---

---

---

---

Slide 19

### Beta Decay

Electron ( $\beta$  particle) is emitted from nucleus

Neutron becomes a proton

${}^1_0\text{n}$  nucleus  $\rightarrow$   ${}^{14}_6\text{C}$  nucleus  $\rightarrow$   ${}^{14}_7\text{N}$  nucleus +  ${}^0_{-1}\text{e}$

Tio, Chemistry: A Molecular Approach Copyright © 2009 Pearson Education, Inc. 19

---

---

---

---

---

---

---

---

Slide 20

### Gamma Emission ${}^0_0\gamma$

- gamma ( $\gamma$ ) rays are high energy photons of light
- no loss of particles from the nucleus
- no change in the composition of the nucleus
  - ✓ Same atomic number and mass number
- least ionizing, but most penetrating
- generally occurs after the nucleus undergoes some other type of decay and the remaining particles rearrange

Tio, Chemistry: A Molecular Approach Copyright © 2009 Pearson Education, Inc. 20

---

---

---

---

---

---

---

---

Slide 21

### Positron Emission

- positron has a charge of +1 c.u. and negligible mass
  - ✓ anti-electron
- when an atom loses a positron from the nucleus, its
  - ✓ mass number remains the same
  - ✓ atomic number decreases by 1
- positrons appear to result from a proton changing into a neutron

$${}^{22}_{11}\text{Na} \rightarrow {}^0_{+1}\text{e} + {}^{22}_{10}\text{Ne}$$

Slide 25

Decay Mode	Process	Change in: A Z N	Example
$\alpha$	Parent nuclide $\rightarrow$ Daughter nuclide + $\alpha$ particle	-4 -2 Decrease	$^{238}_{92}\text{U} \rightarrow ^{234}_{90}\text{Th} + ^4_2\text{He}$
$\beta^-$	Neutron $\rightarrow$ Proton + electron Parent nuclide $\rightarrow$ Daughter nuclide + $\beta^-$ particle	0 +1 Decrease	$^{234}_{90}\text{Th} \rightarrow ^{234}_{91}\text{Pa} + ^0_{-1}\text{e}$
$\gamma$	Excited nuclide $\rightarrow$ Stable nuclide + Photon	0 0 None	$^{234\text{m}}_{90}\text{Th} \rightarrow ^{234}_{90}\text{Th} + \gamma$
Positron emission	Proton $\rightarrow$ Neutron + Positron Parent nuclide $\rightarrow$ Daughter nuclide + Positron	0 -1 Increase	$^{23}_{11}\text{B} \rightarrow ^{23}_{10}\text{Be} + ^0_{+1}\text{e}$
Electron capture	Proton + Electron $\rightarrow$ Neutron Parent nuclide $\rightarrow$ Daughter nuclide	0 -1 Increase	$^{26}_{12}\text{Mg} + ^0_{-1}\text{e} \rightarrow ^{26}_{11}\text{Na}$

\*Neutron to proton ratio

---

---

---

---

---

---

---

---

---

---

Slide 26

### Nuclear Equations

- in the nuclear equation, mass numbers and atomic numbers are conserved
- we can use this fact to determine the identity of a daughter nuclide if we know the parent and mode of decay

$$\begin{array}{c}
 x + 4 = 232; x = 228 \\
 ^{232}_{90}\text{Th} \longrightarrow \left\{ \begin{array}{c} x? \\ y? \end{array} \right\} + ^4_2\text{He} \\
 y + 2 = 90; y = 88
 \end{array}$$

Tro, Chemistry: A Molecular Approach 26

---

---

---

---

---

---

---

---

---

---

Slide 27

### Ex 19.2b - Write the Nuclear Equation for Positron Emission From K-40

1) Write the nuclide symbols for both the starting radionuclide and the particle

$$\text{K} - 40 = ^{40}_{19}\text{K}$$

$$\text{positron} = ^0_{+1}\text{e}$$

Tro, Chemistry: A Molecular Approach 27

---

---

---

---

---

---

---

---

---

---

Slide 28

Ex. 19.2b - Write the Nuclear Equation for Positron Emission From K-40

- 2) Set up the equation
- emitted particles are products
  - captured particles are reactants

---

---

---

---

---

---

---

---

Slide 29

Ex. 19.2b - Write the Nuclear Equation for Positron Emission From K-40

- 3) Determine the mass number and atomic number of the missing nuclide
- mass and atomic numbers are conserved

---

---

---

---

---

---

---

---

Slide 30

Ex. 19.2b - Write the Nuclear Equation for Positron Emission From K-40

- 4) Determine the element from the atomic number

---

---

---

---

---

---

---

---

Slide 31

Practice - Write a nuclear equation for each of the following

- alpha emission from U-238
- beta emission from Ne-24
- positron emission from N-13
- electron capture by Be-7

Tro, Chemistry: A Molecular Approach 31

---

---

---

---

---

---

---

---

Slide 32

Practice - Write a nuclear equation for each of the following

- alpha emission from U-238
- beta emission from Ne-24
- positron emission from N-13
- electron capture by Be-7

${}_{10}^{24}\text{Ne} \rightarrow {}_{-1}^0\text{e} + {}_{11}^{24}\text{Na}$

${}_{7}^{13}\text{N} \rightarrow {}_{+1}^0\text{e} + {}_{6}^{13}\text{C}$

${}_{4}^{7}\text{Be} + {}_{-1}^0\text{e} \rightarrow {}_{3}^{7}\text{Li}$

Tro, Chemistry: A Molecular Approach 32

---

---

---

---

---

---

---

---

Slide 33

What Causes Nuclei to Break Down?

- the particles in the nucleus are held together by a very strong attractive force only found in the nucleus called the **strong force**
  - ✓ acts only over very short distances
- the neutrons play an important role in stabilizing the nucleus, as they add to the strong force, but don't repel each other like the protons do

Tro, Chemistry: A Molecular Approach 33

---

---

---

---

---

---

---

---

Slide 34

### N/Z Ratio

- the ratio of neutrons : protons is an important measure of the stability of the nucleus
- if the N/Z ratio is too high – neutrons are converted to protons via  $\beta$  decay
- if the N/Z ratio is too low – protons are converted to neutrons via positron emission or electron capture
  - ✓ or via  $\alpha$  decay – though not as efficient

Tio, Chemistry: A Molecular Approach 34

---

---

---

---

---

---

---

---

Slide 35

### Valley of Stability

for  $Z = 1 \Rightarrow 20$ ,  
stable  $N/Z \approx 1$

for  $Z = 20 \Rightarrow 40$ ,  
stable  $N/Z$  approaches 1.25

for  $Z = 40 \Rightarrow 80$ ,  
stable  $N/Z$  approaches 1.5

for  $Z > 83$ ,  
there are no stable nuclei

Tio, Chemistry: A Molecular Approach 35

---

---

---

---

---

---

---

---

Slide 36

### Ex 19.3b Determine the kind of radioactive decay that Mg-22 undergoes

- Mg-22
  - ✓  $Z = 12$
  - ✓  $N = 22 - 12 = 10$
- $N/Z = 10/12 = 0.83$
- from  $Z = 1 \Rightarrow 20$ , stable nuclei have  $N/Z \approx 1$
- since Mg-22  $N/Z$  is low, it should convert  $p^+$  into  $n^0$ , therefore it will undergo **positron emission or electron capture**

Tio, Chemistry: A Molecular Approach 36

---

---

---

---

---

---

---

---

Slide 37

### Magic Numbers

- besides the N/Z ratio, the actual numbers of protons and neutrons effects stability
- most stable nuclei have even numbers of protons and neutrons
- only a few have odd numbers of protons and neutrons
- if the total number of nucleons adds to a magic number, the nucleus is more stable
  - same idea as the electrons in the noble gas resulting in a more stable electron configuration
  - most stable when N or Z = 2, 8, 20, 28, 50, 82; or N = 126

**TABLE 19.2** Number of Stable Nucleides with Even and Odd Numbers of Nucleons

Z	N	Number of Nucleides
Even	Even	137
Even	Odd	55
Odd	Even	50
Odd	Odd	5

Tlo, Chemistry: A Molecular Approach 37

---

---

---

---

---

---

---

---

---

---

Slide 38

### Decay Series

- in nature, often one radioactive **nuclide** changes in another radioactive nuclide
  - daughter nuclide is also radioactive
- all of the radioactive nuclides that are produced one after the other until a stable nuclide is made is called a **decay series**
- to determine the stable nuclide at the end of the series without writing it all out
  - count the number of  $\alpha$  and  $\beta$  decays
  - from the mass no. subtract 4 for each  $\alpha$  decay
  - from the atomic no. subtract 2 for each  $\alpha$  decay and add 1 for each  $\beta$

Tlo, Chemistry: A Molecular Approach 38

---

---

---

---

---

---

---

---

---

---

Slide 40

**Detecting Radioactivity**

To detect something, you need to identify what it does

- Radioactive rays can expose light-protected photographic film

Use photographic film to detect its presence – **film badges**

Tro's Introductory Chemistry, Chapter 17 40

---

---

---

---

---

---

---

---

Slide 41

**Detecting Radioactivity**

- Radioactive rays cause air to become ionized

An **electroscope** detects radiation by its ability to penetrate the flask and ionize the air inside

A **Geiger-Müller Counter** works by counting electrons generated when Ar gas atoms are ionized by radioactive rays

Tro's Introductory Chemistry, Chapter 17 41

---

---

---

---

---

---

---

---

Slide 42

**Detecting Radioactivity**

- Radioactive rays cause certain chemicals to give off a flash of light when they strike the chemical

A **scintillation counter** is able to count the number of flashes per minute

42

---

---

---

---

---

---

---

---

Slide 43

**Natural Radioactivity**

- there are small amounts of radioactive minerals in the air, ground, and water
- even in the food you eat!
- the radiation you are exposed to from natural sources is called **background radiation**

Tro, Chemistry: A Molecular Approach 43

---

---

---

---

---

---

---

---

Slide 44

**Rate of Radioactivity**

- it was discovered that the rate of change in the amount of radioactivity was constant and different for each radioactive "isotope"
  - ✓ change in radioactivity measured with Geiger counter
    - counts per minute
  - ✓ each radionuclide had a particular length of time it required to lose half its radioactivity
    - a constant half-life
  - ✓ we know that processes with a constant half-life follow **first order kinetic rate laws**
- **rate of change not affected by temperature**
  - ✓ means that radioactivity is not a chemical reaction!

Tro, Chemistry: A Molecular Approach 44

---

---

---

---

---

---

---

---

Slide 45

**Kinetics of Radioactive Decay**

- Rate =  $kN$ 
  - ✓  $N$  = number of radioactive nuclei
- $t_{1/2} = 0.693/k$
- the shorter the half-life, the more nuclei decay every second – we say the sample is hotter

$$\ln \frac{N_t}{N_0} = -kt = \ln \frac{\text{rate}_t}{\text{rate}_0}$$

Tro, Chemistry: A Molecular Approach 45

---

---

---

---

---

---

---

---

Slide 46

### Half-Lives of Various Nuclides

Nuclide	Half-Life	Type of Decay
Th-232	$1.4 \times 10^{10}$ yr	alpha
U-238	$4.5 \times 10^9$ yr	alpha
C-14	5730 yr	beta
Rn-220	55.6 sec	alpha
Th-219	$1.05 \times 10^{-6}$ sec	alpha

Slide 52

**Object Dating**

- mineral (geological)
  - ✓ compare the amount of U-238 to Pb-206
  - ✓ compare amount of K-40 to Ar-40
- archaeological (once living materials)
  - ✓ compare the amount of C-14 to C-12
  - ✓ C-14 radioactive with half-life = 5730 yrs.
  - ✓ while substance living, C-14/C-12 fairly constant
    - CO<sub>2</sub> in air ultimate source of all C in organism
    - atmospheric chemistry keeps producing C-14 at the nearly the same rate it decays
  - ✓ once dies C-14/C-12 ratio decreases
  - ✓ limit up to 50,000 years

Tro, Chemistry: A Molecular Approach 52

---

---

---

---

---

---

---

---

Slide 53

**Radiocarbon Dating**  
**C-14 Half-Life = 5730 yrs**

% C-14 (relative to living organism)	Number of Half-Lives	Time (yrs)
100.0	0	0
50.0	1	5,730
25.00	2	11,460
12.50	3	17,190

---

---

---

---

---

---

---

---

---

---

Slide 56

### Nonradioactive Nuclear Changes

- a few nuclei are so unstable that if their nucleus is hit just right by a neutron, the large nucleus splits into two smaller nuclei - this is called **fission**
- small nuclei can be accelerated to such a degree that they overcome their charge repulsion and smash together to make a larger nucleus - this is called **fusion**
- both fission and fusion release enormous amounts of energy**
  - fusion releases more energy per gram than fission

  
 Lise Meitner

Slide 58

**Fission Chain Reaction**

- a **chain reaction** occurs when a reactant in the process is also a product of the process
  - ✓ in the fission process it is the neutrons
  - ✓ so you only need a small amount of neutrons to start the chain
- many of the neutrons produced in fission are either ejected from the uranium before they hit another U-235 or are absorbed by the surrounding U-238
- minimum amount of fissionable isotope needed to sustain the chain reaction is called the **critical mass**

Slide 60

Albert Einstein  
82 West 87th St.  
New York, N.Y.  
January 30, 1955

Some recent work by E. Fermi and L. Szilard, which has been communicated to me in manuscript, leads me to expect that the element uranium may be turned into a new and important source of energy in the immediate future. Certain aspects of the situation which has arisen seem to call for watchfulness and, if necessary, quick action on the part of the Administration. I believe therefore that it is my duty to bring to your attention the following facts and recommendations:

\* \* \*

object herein that this should be referred to the appropriate Federal...  
There are numerous ways also lead to the production of energy,  
and it is conceivable - though with less certainty - that extremely powerful  
the source of a new type may have to be constructed, a single bomb of this  
type, needed for heat and exploded in a part, might very well destroy  
the United States together with some of the surrounding territories. However,  
such bombs might very well appear to be too ready for manufacture by  
others.

Tro, Chemistry: A Molecular Approach 60

---

---

---

---

---

---

---

Slide 61

**Fissionable Material**

- fissionable isotopes include U-235, Pu-239, and Pu-240
- natural uranium is less than 1% U-235
  - ✓ rest mostly U-238
  - ✓ not enough U-235 to sustain chain reaction
- to produce fissionable uranium, the natural uranium must be **enriched** in U-235
  - ✓ to about 7% for “weapons grade”
  - ✓ to about 3% for reactor grade

Tro, Chemistry: A Molecular Approach 61

---

---

---

---

---

---

---

---

Slide 62

**Nuclear Power**

- Nuclear reactors use fission to generate electricity
  - ✓ About 20% of U.S. electricity
  - ✓ The fission of U-235 produces heat
- The heat boils water, turning it to steam
- The steam turns a turbine, generating electricity

Tro, Chemistry: A Molecular Approach 62

---

---

---

---

---

Slide 63

**Nuclear Power Plants vs. Coal-Burning Power Plants**

<ul style="list-style-type: none"><li>• Use about 50 kg of fuel to generate enough electricity for 1 million people</li><li>• No air pollution</li></ul>	<ul style="list-style-type: none"><li>• Use about 2 million kg of fuel to generate enough electricity for 1 million people</li><li>• Produces NO<sub>2</sub> and SO<sub>x</sub> that add to acid rain</li><li>• Produces CO<sub>2</sub> that adds to the greenhouse effect</li></ul>
--	--

Tro, Chemistry: A Molecular Approach 63

---

---

---

---

---

---

---

---

Slide 64

**Nuclear Power Plants - Core**

- the fissionable material is stored in long tubes, called **fuel rods**, arranged in a matrix
  - ✓ subcritical
- between the fuel rods are **control rods** made of neutron absorbing material
  - ✓ B and/or Cd
  - ✓ neutrons needed to sustain the chain reaction
- the rods are placed in a material to slow down the ejected neutrons, called a **moderator**
  - ✓ allows chain reaction to occur below critical mass

Tro, Chemistry: A Molecular Approach 64

---

---

---

---

---

---

---

---

Slide 65

**Pressurized Light Water Reactor**

- design used in U.S. (GE, Westinghouse)
- water is both the coolant and moderator
- water in core kept under pressure to keep it from boiling
- fuel is enriched uranium
  - ✓ subcritical
- containment dome of concrete

Slide 69

### Concerns About Nuclear Power

- core melt-down
  - ✓ water loss from core, heat melts core
  - ✓ China Syndrome
  - ✓ Chernobyl
- waste disposal
  - ✓ waste highly radioactive
  - ✓ reprocessing, underground storage?
  - ✓ Federal High Level Radioactive Waste Storage Facility at Yucca Mountain, Nevada
- transporting waste
- how do we deal with nuclear power plants that are no longer safe to operate?
  - ✓ Yankee Rowe

Tro, Chemistry: A Molecular Approach 69

---

---

---

---

---

---

---

Slide 70

### Where Does the Energy from Fission Come From?

- during nuclear fission, some of the mass of the nucleus is converted into energy
  - ✓  $E = mc^2$
- each mole of U-235 that fissions produces about  $1.7 \times 10^{13}$  J of energy
  - ✓ a very exothermic chemical reaction produces  $10^6$  J per mole

Tio, Chemistry: A Molecular Approach 70

---

---

---

---

---

---

---

---

Slide 71

### Mass Defect and Binding Energy

- when a nucleus forms, some of the mass of the separate nucleons is converted into energy
- the difference in mass between the separate nucleons and the combined nucleus is called the **mass defect**
- the energy that is released when the nucleus forms is called the **binding energy**
  - ✓  $1 \text{ MeV} = 1.602 \times 10^{-13} \text{ J}$
  - ✓  $1 \text{ amu of mass defect} = 931.5 \text{ MeV}$
  - ✓ the greater the binding energy per nucleon, the more stable the nucleus is

Tio, Chemistry: A Molecular Approach 71

---

Slide 73

### Nuclear Fusion

- Fusion is the combining of light nuclei to make a heavier one
- The sun uses the fusion of hydrogen isotopes to make helium as a power source
- Requires high input of energy to initiate the process
  - ✓ Because need to overcome repulsion of positive nuclei
- Produces 10x the energy per gram as fission
- No radioactive byproducts
- Unfortunately, the only currently working application is the H-bomb

Slide 76

### Artificial Transmutation

- bombardment of one nucleus with another causing new atoms to be made
  - ✓ can also bombard with neutrons
- reaction done in a particle accelerator
  - ✓ linear
  - ✓ cyclotron

Tc-97 is made by bombarding Mo-96 with deuterium, releasing a neutron

$${}_{42}^{96}\text{Mo} + {}_1^2\text{H} \rightarrow {}_{43}^{97}\text{Tc} + {}_0^1\text{n}$$

Slide 79

**Biological Effects of Radiation**

- Radiation is high energy, energy enough to knock electrons from molecules and break bonds
  - ✓ **Ionizing radiation**
- Energy transferred to cells can damage biological molecules and cause malfunction of the cell

Tro, Chemistry: A Molecular Approach 79

---

---

---

---

---

---

---

---

Slide 80

**Acute Effects of Radiation**

- High levels of radiation over a short period of time kill large numbers of cells
  - ✓ From a nuclear blast or exposed reactor core
- Causes weakened immune system and lower ability to absorb nutrients from food
  - ✓ May result in death, usually from infection

Tro, Chemistry: A Molecular Approach 80

---

---

---

---

---

---

---

---

Slide 81

**Chronic Effects**

- Low doses of radiation over a period of time show an increased risk for the development of cancer
  - ✓ Radiation damages DNA that may not get repaired properly
- Low doses over time may damage reproductive organs, which may lead to sterilization
- Damage to reproductive cells may lead to a genetic defect in offspring

Tro, Chemistry: A Molecular Approach 81

---

---

---

---

---

---

---

---

Slide 82

### Measuring Radiation Exposure

- the **curie (Ci)** is an exposure of  $3.7 \times 10^{10}$  events per second
  - ✓ no matter the kind of radiation
- the **gray (Gy)** measures the amount of energy absorbed by body tissue from radiation
  - ✓  $1 \text{ Gy} = 1 \text{ J/kg}$  body tissue
- the **rad** also measures the amount of energy absorbed by body tissue from radiation
  - ✓  $1 \text{ rad} = 0.01 \text{ Gy}$
- a correction factor is used to account for a number of factors that affect the result of the exposure – this biological effectiveness factor is the **RBE**, and the result is the dose in **rems**
  - ✓  $\text{rads} \times \text{RBE} = \text{rems}$
  - ✓  $\text{rem} = \text{roentgen equivalent man}$

Tio, Chemistry: A Molecular Approach 82

---

---

---

---

---

---

---

---

---

---

Slide 83

### Factors that Determine Biological Effects of Radiation

1. The more energy the radiation has, the larger its effect can be
2. The better the ionizing radiation penetrates human tissue, the deeper effect it can have
  - ✓  $\text{Gamma} \gg \text{Beta} > \text{Alpha}$
3. The more ionizing the radiation, the larger the effect of the radiation
  - ✓  $\text{Alpha} > \text{Beta} > \text{Gamma}$
4. The radioactive half-life of the radionuclide
5. The biological half-life of the element
6. The physical state of the radioactive material

Tio, Chemistry: A Molecular Approach 83

Slide 84

**TABLE 19.4 Exposure by Source for Persons Living in the United States**

Source	Dose
<b>Natural Radiation</b>	
A 5-hour jet airplane ride	2.5 mrem/trip (0.5 mrem/hr at 29,000 feet) (Whole body dose)
Cosmic radiation from outer space	27 mrem/yr (whole body dose)
Terrestrial radiation	28 mrem/yr (whole body dose)
Natural radionuclides in the body	35 mrem/yr (whole body dose)
Radon gas	200 mrem/yr (lung dose)
<b>Diagnostic Medical Procedures</b>	
Chest X-ray	8 mrem (whole body dose)
Dental X-rays (panoramic)	30 mrem (skin dose)
Dental X-rays (two bitewings)	40 mrem (skin dose)
Mammogram	138 mrem per image
Barium enema (X-ray portion only)	406 mrem (bone marrow dose)
Upper gastrointestinal tract	244 mrem (X-ray portion only) (bone marrow dose)
Thallium heart scan	500 mrem (whole-body dose)
<b>Consumer Products</b>	
Building materials	3.5 mrem/year (whole body dose)
Luminous watches (K-3 and Pm-147)	0.04–0.1 mrem/year (whole body dose)
Tobacco products (to smokers of 30 cigarettes per day)	16,000 mrem/year (bronchial epithelial dose)

Slide 85

### Biological Effects of Radiation

- The amount of danger to humans of radiation is measured in the unit **rems**

Dose (rems)	Probable Outcome
20-100	decreased white blood cell count; possible increased cancer risk
100-400	radiation sickness; increased cancer risk
500+	death

Slide 86

### Medical Uses of Radioisotopes, Diagnosis

- radiotracers
  - certain organs absorb most or all of a particular element
  - can measure the amount absorbed by using tagged isotopes of the element and a Geiger counter
  - use radioisotope with short half-life
  - use radioisotope low ionizing
    - beta or gamma

Slide 90

**Medical Uses of Radioisotopes,  
Treatment - Radiotherapy**

- cancer treatment
  - ✓ cancer cells more sensitive to radiation than healthy cells
  - ✓ **brachytherapy**
    - place radioisotope directly at site of cancer
  - ✓ **teletherapy**
    - use gamma radiation from Co-60 outside to penetrate inside
    - IMRT
  - ✓ **radiopharmaceutical therapy**
    - use radioisotopes that concentrate in one area of the body
