

Slide 1

Acid/Base solutions

---

---

---

---

---

---

---

Slide 2

What is an acid?  
Bronsted-Lowry definition: An acid is a proton donor.  
So, what's a base?  
Bronsted-Lowry definition: A base is a proton acceptor.

---

---

---

---

---

---

---

Slide 3

They go together...like carrots and peas,  
Forrest.  
If you are going to donate a proton, something  
must accept it.  
You can't really be an acid without a base.

---

---

---

---

---

---

---

Slide 4

What's the most common acid?

Water!!

H-OH, it has a proton it can donate.

---

---

---

---

---

---

---

Slide 5

What's the most common base?

Water!

••  
H - O - H  
••

It has extra electrons on the oxygen, so a proton can stick to it.

---

---

---

---

---

---

---

Slide 6

Water is special...

...it is amphoteric: it can act as an acid or a base.

It's not the only compound that can, we'll see other's later.

It also means that most Bronsted-Lowry acids or bases can dissolve in water.

---

---

---

---

---

---

---

Slide 7

**We like water...**

Acids and bases like water...

So, acids and bases are mostly found as aqueous solutions here.

Like all solutions, the concentration is a critical parameter.

---

---

---

---

---

---

---

---

Slide 8

**All solutions are created equal...**

Like any other aqueous solution, a solution of either an acid or base is defined by its concentration.

So what's this thing called pH?

---

---

---

---

---

---

---

---

Slide 9

**pH is concentration**

The pH scale is just a logarithmic scale for the Molarity of the protons in the solution.

The pH scale is logarithmic (the difference between pH=1 and pH=2 is a factor of 10)

pH is concentration

---

---

---

---

---

---

---

---

Slide 10

**Damn those logs**

pH = - log [H<sup>+</sup>]

[x] always means "concentration of x"

[H<sup>+</sup>] should be in M.

pH is ONLY the concentration of H<sup>+</sup>.

---

---

---

---

---

---

---

Slide 11

**Example**

1 M HCl solution. What's the pH?

Implicitly, you must recognize that:

$$\text{HCl}_{(aq)} \rightarrow \text{H}^+_{(aq)} + \text{Cl}^-_{(aq)}$$

Or,  $\text{HCl}_{(aq)} + \text{H}_2\text{O}_{(l)} \rightarrow \text{H}_3\text{O}^+_{(aq)} + \text{Cl}^-_{(aq)}$

pH = - log [H<sup>+</sup>] = - log [H<sub>3</sub>O<sup>+</sup>]

pH = - log (1 M) = 0

---

---

---

---

---

---

---

Slide 12

**Another example**

2.4 M H<sub>2</sub>SO<sub>4</sub>. What's the pH?

In this case, you must recognize:

$$\text{H}_2\text{SO}_{4(aq)} \rightarrow 2\text{H}^+_{(aq)} + \text{SO}_4^{2-}_{(aq)}$$

So [H<sup>+</sup>] = 2[H<sub>2</sub>SO<sub>4</sub>]

[H<sup>+</sup>] = 2(2.4 M) = 4.8 M

---

---

---

---

---

---

---

Slide 13

**ICE chart**

I think it is easier to see what's going on if you follow the concentrations in an "ICE" chart.

I = initial  
C = change (during reaction)  
E = End (or equilibrium) amounts

---

---

---

---

---

---

---

---

Slide 14

$$\text{H}_2\text{SO}_4(\text{aq}) \rightarrow 2\text{H}^+(\text{aq}) + \text{SO}_4^{2-}(\text{aq})$$

I	2.4 M	0	0
C	-1x	+2x	+1x
E	0	2x	1x

Each column is a little algebra problem:  
Initial + change = End  
 $2.4 + (-1x) = 0$   
 $x = 2.4$

---

---

---

---

---

---

---

---

Slide 15

$$\text{H}_2\text{SO}_4(\text{aq}) \rightarrow 2\text{H}^+(\text{aq}) + \text{SO}_4^{2-}(\text{aq})$$

I	2.4 M	0	0
C	-2.4	+2(2.4)	+2.4
E	0	4.8	2.4

Each column is a little algebra problem:  
Initial + change = End  
 $2.4 + (-1x) = 0$   
 $x = 2.4$

---

---

---

---

---

---

---

---

Slide 16

The lies you were told in HS...

$\text{pH} = -\log [\text{H}^+] = -\log (4.8) = -0.68$

Now,  $\text{pH} = -0.68$  might be surprising to you.

A common "Earth Science lie" is that the pH scale goes from 0 to 14.

I am here to tell you the truth! ☺

---

---

---

---

---

---

---

Slide 17

The Truth according to Joe

$\text{pH} = -\log [\text{H}^+]$  by definition

So, pH is governed by the limits of the concentration of  $\text{H}^+$  only.

---

---

---

---

---

---

---

Slide 18

The Truth according to Joe

The highest  $[\text{H}^+]$  is 56 M (because pure water is 56 M!)  
The smallest pH is, therefore -1.7

The highest pH is a little harder to define. What if you had 1 atom of  $\text{H}^+$  in a liter of water? Then the concentration would be  $1.66 \times 10^{-24}$  and the  $\text{pH} = 23.78$  (although 16-18 is more common as the upper end of the pH scale)

---

---

---

---

---

---

---

Slide 19

Bottom Line according to Joe  
pH is simply a logarithmic concentration scale.

---

---

---

---

---

---

---

---

Slide 20

New example  
What is the pH of 2.4 M NaOH solution?

---

---

---

---

---

---

---

---

Slide 21

New example  
What is the pH of 2.4 M NaOH solution?  
  
What is NaOH?  
  
It's a Base!

---

---

---

---

---

---

---

---

Slide 22

**New example**

What is the pH of 2.4 M NaOH solution?

Where's the H<sup>+</sup>?

What does NaOH do in solution?

---

---

---

---

---

---

---

---

Slide 23

**New example**

What is the pH of 2.4 M NaOH solution?

$\text{NaOH}_{(aq)} \rightarrow \text{Na}^+_{(aq)} + \text{OH}^-_{(aq)}$

I still don't see the H<sup>+</sup>?

---

---

---

---

---

---

---

---

Slide 24

**Autoionization of water**

Water is a special molecule for many reasons:

1. Polar solvent
2. Unusually high boiling point
3. It expands when it freezes
4. It is amphiprotic

---

---

---

---

---

---

---

---

Slide 25

### Amphi-who?

Amphiprotic means that water can act as either an acid or a base.

What happens when you mix an acid and base together?

They neutralize each other.

---

---

---

---

---

---

---

---

Slide 26

If you mix water with water...

**It neutralizes itself!**

---

---

---

---

---

---

---

---

Slide 27

### Autoionization of water

What's with the " $\leftrightarrow$ "?

$\leftrightarrow$  means that the reaction goes both ways. It is an "equilibrium reaction"

---

---

---

---

---

---

---

---

Slide 28

**Equilibrium Reactions**

Equilibrium reactions have a balance between the reactants and the products.

In the case of the autoionization of water:

$$[\text{H}_3\text{O}^+][\text{OH}^-] = 1 \times 10^{-14}$$

(the equilibrium constant expression – is this familiar?)

---

---

---

---

---

---

---

---

Slide 29

**What does this mean?**

It means that in aqueous solutions, you ALWAYS have BOTH  $\text{H}^+$  and  $\text{OH}^-$  present.

In fact, you can define pOH similarly to pH:

$$\text{pOH} = -\log [\text{OH}^-]$$

And pOH and pH should be related.

---

---

---

---

---

---

---

---

Slide 30

**The Relationship**

How are they related?

$$[\text{OH}^-][\text{H}^+] = 1 \times 10^{-14}$$
$$-\log([\text{OH}^-][\text{H}^+]) = -\log(1 \times 10^{-14})$$
$$-\log([\text{OH}^-]) + (-\log[\text{H}^+]) = -\log(1 \times 10^{-14})$$
$$\text{pOH} + \text{pH} = 14$$

(this is the reason for the Earth Science Lie)

---

---

---

---

---

---

---

---

Slide 31

Returning to our base problem

What is the pH of 2.4 M NaOH solution?

$$\text{NaOH}_{(aq)} \rightarrow \text{Na}^+_{(aq)} + \text{OH}^-_{(aq)}$$

How would you solve it?

---

---

---

---

---

---

---

---

Slide 32

Returning to our base problem

What is the pH of 2.4 M NaOH solution?

$$\text{NaOH}_{(aq)} \rightarrow \text{Na}^+_{(aq)} + \text{OH}^-_{(aq)}$$

How would you solve it?

2 ways:

- Calculate  $[\text{H}^+]$  from  $[\text{OH}^-]$
- Calculate pH from pOH

---

---

---

---

---

---

---

---

Slide 33

$[\text{H}^+]$  from  $[\text{OH}^-]$

What is the pH of 2.4 M NaOH solution?

$$\text{NaOH}_{(aq)} \rightarrow \text{Na}^+_{(aq)} + \text{OH}^-_{(aq)}$$
$$[\text{H}^+][\text{OH}^-] = 1 \times 10^{-14}$$
$$[\text{H}^+][2.4] = 1 \times 10^{-14}$$
$$[\text{H}^+] = 4.17 \times 10^{-15}$$
$$\text{pH} = -\log(4.17 \times 10^{-15}) = 14.38$$

---

---

---

---

---

---

---

---

Slide 34

**pH from pOH**

What is the pH of 2.4 M NaOH solution?

$$\text{NaOH}_{(aq)} \rightarrow \text{Na}^+_{(aq)} + \text{OH}^-_{(aq)}$$

$\text{pOH} = -\log(2.4) = -0.38$   
 $\text{pH} + \text{pOH} = 14$   
 $\text{pH} + (-0.38) = 14$   
 $\text{pH} = 14.38$

---

---

---

---

---

---

---

---

Slide 35

**Why is pH important?**

pH is a measure of the concentration of acid or base.  
Why do we care?

It's still all about the water.

- Acidic water can be corrosive to many materials.
- Life forms on Earth do all of their chemistry in water. This chemistry is optimized in certain pH ranges (usually 6-8).

---

---

---

---

---

---

---

---

Slide 36

**Measuring pH**

There are many ways to measure pH:

- Titration – most accurate – we do this a LOT
- Electrodes – pretty accurate & easy (pH meters)
- Chemical indicators – cheap and “ballpark” (this is the pool test kit)

---

---

---

---

---

---

---

---

Slide 37

Little problems

What is the pH of an aqueous solution that is 1.25 M HCl?

$$\text{pH} = -\log [\text{H}^+] = -\log (1.25 \text{ M})$$
$$\text{pH} = -0.0969$$

---

---

---

---

---

---

---

Slide 38

What is the pH of an aqueous solution that is 0.25 M NaOH?

$$\text{pOH} = -\log (0.25 \text{ M}) = 0.60$$
$$\text{pH} + \text{pOH} = 14$$
$$\text{pH} = 14 - \text{pOH} = 14 - 0.60 = 13.4$$

OR

$$[\text{H}^+][\text{OH}^-] = 1 \times 10^{-14}$$
$$[\text{H}^+](0.25) = 1 \times 10^{-14}$$
$$[\text{H}^+] = 4 \times 10^{-14}$$
$$\text{pH} = -\log (4 \times 10^{-14}) = 13.4$$

---

---

---

---

---

---

---
